

# Joshua Foxworth

## Senior Full Stack Developer • Data Engineer

(832) 385-9440 | jfoxworth@cadwolf.com | www.joshuafoxworth.com

### Professional Summary

---

I have over a decade of experience as a full stack developer at startups and at enterprise level companies. I've worked on front end technologies from jQuery and Angular 1 to Next.js React applications as well as back end technologies from simple postgres databases to full data pipelines across multiple platforms and systems. I've also developed apps and planned and managed sprints.

AWS Cloud Practitioner; AWS Solutions Architect

### Skills

---

Languages : Typescript, Javascript, (Node, React, Angular), Python, SQL, C++, Matlab

Platforms : Apache AirFlow, Apache Spark, Apache Hadoop, DataBricks

AWS : Glue, Redshift, Athena, Lambda, DynamoDB, Lambdas, Event Bridges, Step Functions, S3, etc  
AWS Cloud Practitioner; AWS Certified Solutions Architect

### Highlighted Data Projects

---

- AirTable Data pipeline, ETL - Started with AWS Cloudwatch data which contained log data for article creation, updates, and publication. AWS Lambda runs weekly to place logs in S3. AWS Glue and Event Bridge then extracts data and moves it to a RDS database.
- IFX Pipelines - IFX is a system to trigger events when articles are created, edited, and published. I built an AWS pipeline to take that data, convert it into the proper format, and send it to AirTable. I built a similar system to send AirTable updates to the editor. This involved AWS SQS, SNS, Lambdas, and event bridges

### Professional Experience

---

Full Stack Developer

**DALLAS MORNING NEWS (Later Hearst) (Remote)**

Aug 2021 – Present

- Full Stack Development
  - o Developed and maintained all aspects of the main site as well as supporting systems. Projects included React, React Admin, Tailwind, Material UI, Node, and other technologies. Major front end projects included video integration within the site, live streaming a local sports station, and integrating multiple third party platforms.
  - o The back end included postgres with Apollo and GraphQL with extensive API development across multiple platforms
  - o Sportsgraf - A system to take in, format, and display high school sports stats in the Dallas area. Coaches and staff logged in and entered play by play data for football, basketball, soccer, and other sports and users could view those stats as well as schedules, standings, etc. A React Admin dashboard was used to manage that data. I was one of a few developers that built the database and AWS infrastructure

- o AirTable Integration - I created AWS infrastructure to monitor all articles written at DMN and to send selected data to AirTable where editors could manage the publication of those articles. Automations written in javascript handled photo assignments and sent updates back to the article system. This system was used to run much of the newspaper's editorial process and I was the sole engineer on it
- o Best in DFW - A system of reader voting to select the favorite restaurants, bars, stores, etc in the area. It utilized Google maps to display option locations, tracked votes in a postgres database, and displayed results.
- o Voter Guide - A system to display voting options and results. It read in real time results from AP sources on election days and displayed the results after the elections.
- Logistics and Leadership
  - o DMN ran agile sprints and I created Jira tickets when needed and participated in sprint planning, retros, and all other logistical aspects
- Data & Analytics
  - o DMN used google analytics with events to track user activity. Developers were encouraged to crunch our own data and make conclusions and recommendations based on that data

## Full Stack Developer - Personal Project

### **CheckOnMe.co**

*December 2025–Present*

- CheckOnMe.co is a simple web application that lets a user set times for us to check on them via text or email. They tell us where they're going, who they're going with, who they want to contact if they miss the check in, and when the check in should take place.
- The front end is next.js with react. The back end uses DynamoDB for the data and an event driven infrastructure with multiple Lambda functions, an event bridge scheduler, SQS, SES, SNS, IAM, an API Gateway, and Cloudwatch

## React Developer

### **GORADAR ( Remote Contract Work )**

*January 2021–June 2021*

- Developed a React-Three-Fiber app that mapped out buildings and rooms and then displayed tens of thousands of points representing tagged and tracked products

## Full Stack Developer

### **CADWOLF ( My Startup )**

CADWOLF was an advanced engineering platform. It consisted of "Google Doc" like documents that also had the ability to solve and display equations, show charts, etc. These documents could then be linked together in part trees to facilitate the design of large systems. The system also communicated with CAD platforms to keep those items in sync with the mathematical designs on CADWOLF.

## Education

---

### **UNIVERSITY OF TEXAS AT AUSTIN**

Master of Science in Aerospace Engineering

Bachelor of Science in Aerospace Engineering
