Joshua Foxworth

Sr Full Stack Dev • Data Engineer • AI Dev

(832) 385-9440 | jfoxworth@cadwolf.com | www.joshuafoxworth.com

Certifications

AWS Cloud Practitioner; AWS Solutions Architect, AWS Data Engineer; AWS AI Practitioner
Claude Certified Architect

Summary

I am a full stack developer with over a decade of experience in startups and enterprise companies. I am fluent in several languages and platforms including React w/Typescript and Angular on the front end as well as multiple database technologies from PostGres to DynamoDB to Redshift. I can establish and maintain AWS infrastructure at enterprise level, as well as set up data pipelines and do analysis. I can also establish CI/CD pipelines and integrate AI into the development and distribution pipelines. I have a working knowledge of Machine Learning and generative / agentic AI.

Professional Experience

AI Engineer - Full Stack Developer
Engentic.tech

Engentic is an advanced, AI assisted, structural engineering platform. It uses RAG, generative AI, and agentic AI to assist engineers in designing parts and building large structures.

- RAG - Retrieval Augmented Generation - The platform is built on documents similar to google docs, but with mathematics. Those documents are broken into components for text, equations, symbolic equations, plots, and other things. Those items are vectorized and stored. When a user wants to build a large structure in our part trees, similar designs / documents are found based on this content and used as a template.
- Generative AI - Documents, datasets, and part trees have an assistant that understands our platform and the mathematical functions available to it. Users can prompt that assistant to build documents from scratch, ask it about problems on a document, alter equations, or ask it the proper mathematical process to solve the problem. Users can choose what model to use..
- Agentic AI - The platform's part trees are places where structures are built. Users can build these structures piece by piece or by creating requirements documents, and prompting the AI to build it all. When this is done, an agentic workflow creates an agent to establish the parts to be designed and then creates an agent for the design of each part.

Full Stack Developer
DALLAS MORNING NEWS (Later Hearst) (Remote) *Aug 2021 – June 2026*

- Data Engineering (Solo projects)

    - Sportsgraf - Took in csv files with data such as names, sports, position, schools, etc. Extracted that data, performed data quality checks, and loaded final data into databases for use in high school sports data real time displays and in calculations.
    - IFX and AirTable - Real time article creation and editorial data was streamed to infrastructure that extracted certain data, sent that data to AirTable, and ran calculations on the statistics within that data. Similar infrastructure sent data from AirTable back to our article system. This system became how the entire paper's editorial process was handled and we used the data it generated to address future publication times and procedures
- Full Stack Development
    - Developed and maintained all aspects of the main site as well as supporting systems. Technologies included React, React Admin, Tailwind, Material UI, Node, and postGres databases and API development with GraphQL / Apollo. Major front end projects included video integration within the site, live streaming a local sports station, and integrating multiple third party platforms.
    - Sportsgraf - A system to take in, format, and display high school sports stats in the Dallas area. Coaches and staff logged in and entered play by play data for football, basketball, soccer, and other sports and users could view those stats as well as schedules, standings, etc. A React Admin dashboard was used to manage that data. I was one of a few developers that built the database and AWS infrastructure
    - Best in DFW - A system of reader voting to select the favorite restaurants, bars, stores, etc in the area. It utilized Google maps to display option locations, tracked votes in a postgres database, and displayed results.
    - Voter Guide - A system to display voting options and results. It read in real time results from AP sources on election days and displayed the results after the elections.
- Logistics and Leadership
    - DMN ran agile sprints and I created Jira tickets when needed and participated in sprint planning, retros, and all other logistical aspects

Full Stack Developer - Personal Project

CheckOnMe.co *December 2025–Present*

- CheckOnMe.co lets a user set times for us to check on them via text or email. They tell us where they're going, who they're going with, who they want to contact if they miss the check in, and when the check in should take place.
- The front end is next.js with react. The back end uses DynamoDB for the data and an event driven infrastructure with multiple Lambda functions, an event bridge scheduler, SQS, SES, SNS, IAM, an API Gateway, and Cloudwatch

React Developer

GORADAR (Remote Contract Work) *January 2021–June 2021*

- Developed a React-Three-Fiber app that mapped out buildings and rooms and then displayed tens of thousands of points representing tagged and tracked products

Education

UNIVERSITY OF TEXAS AT AUSTIN
Master of Science in Aerospace Engineering
Bachelor of Science in Aerospace Engineering
